

Abundroid Roadmap Brief

Purpose

Abundroid is envisioned as a conservative, agent-assisted event intelligence system for the abundance ecosystem. The first version should remain focused, reliable, and easy to maintain. More ambitious features should be treated as roadmap items rather than requirements for the initial build.

The goal is to avoid overbuilding too early while preserving a clear path toward a more powerful system.

The core principle is:

Build the sturdy event database first. Add intelligence in layers.

Product Philosophy

Abundroid should not begin as a fully autonomous web agent. It should begin as a reliable pipeline that monitors a human-approved list of organizations, collects event information, tags events by topic, removes duplicates, and sends new events to a review queue.

Agentic features should be introduced gradually and only where they improve usefulness without reducing reliability.

In short:

The database is the source of truth. Agents are helpers. Humans approve important changes.

MVP Scope

The minimum viable version should focus on the essential workflow:

1. Maintain a source registry of approved organizations.
2. Maintain a topic registry of abundance-related themes.
3. Pull events from approved sources.
4. Normalize event data into a consistent structure.
5. Tag events by topic.
6. Detect likely duplicates.
7. Send events to a human review queue.
8. Allow users to approve, reject, edit, or mark events as duplicates.
9. Support simple queries over approved events.

MVP Capabilities

The first version should be able to answer basic questions such as:

- What events are happening this week?
- What housing events are coming up?
- What events are near San Francisco?
- What online events are available?
- Which organizations have upcoming events?

The first version should also include a small number of focused agents:

- **Classifier Agent:** suggests topics for each event.
- **Deduper Agent:** flags likely duplicate events.
- **Query Agent:** lets users ask simple natural-language questions about the event database.
- **Source Health Agent:** flags broken or inactive sources.

Roadmap: Potential Future Features

The following features should be considered future roadmap ideas. They are valuable, but they should not block the initial build.

1. Autonomous Source Discovery

Idea

Abundroid could eventually suggest new organizations, event pages, speakers, and recurring event series based on patterns in the approved database.

For example, if several monitored organizations repeatedly mention a new partner group, Abundroid could flag that group as a possible source to add.

Example Output

“California YIMBY has been mentioned by four monitored organizations and appears to co-host multiple housing-related events. Suggested action: add to watchlist.”

Guardrail

Abundroid should not automatically add new sources to the official registry. It should only suggest them for human review.

Status

Future feature.

2. Watchlist for Suggested Organizations

Idea

Create a middle layer between “unknown source” and “approved source.”

A suggested organization could be placed on a watchlist before being officially monitored.

Workflow

1. Scout Agent identifies a possible new organization.
2. Organization is added to “Suggested Sources.”
3. Human reviewer marks it as:
 4. Add to watchlist
 5. Approve as source
 6. Ignore
 7. Reject

Why It Matters

This keeps the ecosystem flexible without letting the bot expand too aggressively.

Status

Future feature.

3. Public Website or Calendar

Idea

Approved events could eventually be published to a simple public-facing website or calendar.

Possible outputs include:

- Public event calendar
- Searchable event directory
- Topic-specific event pages
- City-specific event pages
- Public RSS or iCal feed

Example Pages

- Upcoming Housing Abundance Events
- Upcoming Energy and Permitting Events

- Bay Area Abundance Events
- Online Abundance Events

Guardrail

Only approved events should be published.

Status

Future feature.

4. Personalized Alerts

Idea

Users could subscribe to alerts based on their interests.

Examples:

- New housing event near me
- Online state-capacity events
- Events featuring a watched speaker
- New water infrastructure events
- Events from core organizations only

Possible Notification Channels

- Email
- Slack
- Discord
- Calendar feed
- Weekly digest

Guardrail

Alerts should be opt-in. Abundroid should not message users unless they have subscribed.

Status

Future feature.

5. Automated Weekly Digest

Idea

Abundroid could draft a weekly events digest from approved events.

The digest could include:

- Top upcoming events
- Events by topic
- Events by location
- New organizations to watch
- Notable speakers
- Emerging themes

Example Digest Sections

- This Week in Abundance
- Housing and Permitting
- Energy and Infrastructure
- State Capacity and Governance
- Online Events
- Bay Area Events

Guardrail

The Digest Agent may draft the email, but a human should review and send it.

Status

Future feature, though a simple manual digest could be part of the MVP.

6. Deep Relationship Graph

Idea

Abundroid could eventually map relationships between organizations, speakers, topics, cities, and events.

Instead of simply storing events as rows, the system would understand connections.

Relationship Examples

- Organization A co-hosted Event X with Organization B.
- Speaker Y appeared at three housing events.
- Topic Z appeared in twelve approved events this month.
- City Q has five upcoming infrastructure events.
- Organization C is increasingly active in energy permitting.

Why It Matters

This would turn Abundroid from an event tracker into an ecosystem intelligence tool.

Status

Future feature.

7. Speaker Tracking

Idea

Track speakers across events and organizations.

The system could answer:

- Who is speaking most often about housing abundance?
- Which speakers appear across multiple organizations?
- Who is newly appearing in the ecosystem?
- Which speakers are tied to which topics?

Guardrail

Speaker profiles should be based only on public event information.

Status

Future feature.

8. Topic Trend Dashboard

Idea

Create a dashboard showing which abundance topics are becoming more active over time.

Possible trends:

- Housing events increasing this month
- Energy permitting events slowing down
- Water infrastructure emerging as a topic
- State capacity appearing across multiple unrelated events
- More events moving from online to in-person

Example Questions

- What topics are heating up?
- Is housing dominating the ecosystem this month?
- Is water infrastructure becoming more prominent?
- Which topics are underrepresented?

Status

Future feature.

9. City and Regional Mapping

Idea

Map events by city, region, or state.

This would help users find local activity and identify where the abundance ecosystem is strongest.

Example Queries

- What is happening near me?
- Which cities have the most abundance events?
- What is happening in California this month?
- Are there any events near San Francisco?
- Which regions are most active on housing or infrastructure?

Status

Future feature.

10. Personalized Recommendation Agent

Idea

Once enough events exist in the database, Abundroid could recommend events based on user interests.

Example user profile:

- Interested in housing, water, infrastructure, and state capacity.
- Located in the Bay Area.
- Prefers online or local events.
- Wants monthly summaries, not daily alerts.

Example Output

"Based on your interests, these three upcoming events are probably most relevant: one on housing permitting, one on water infrastructure, and one on local government capacity."

Guardrail

Recommendations should be explainable and based on approved event records.

Status

Future feature.

11. Advanced Query Assistant

Idea

The Query Agent could become more powerful over time.

Instead of only answering simple searches, it could answer ecosystem-level questions.

Example Questions

- Who is doing interesting stuff in housing this month?
- What organizations are most active on permitting reform?
- What are the most practical implementation-focused events coming up?
- What is the difference between the housing events and the energy events this month?
- What should I attend if I care about water infrastructure?
- Which new organizations are showing up repeatedly?

Guardrail

The Query Agent should answer from the approved database first. It should not invent events or rely on unsupported claims.

Status

Future feature.

12. Source Reliability Scoring

Idea

Score sources based on how useful and reliable they are.

Possible factors:

- How often the source has events.
- How often extraction succeeds.
- How often events are approved.
- How often events are duplicates.
- How relevant the events are.
- Whether the event page frequently breaks.

Example Output

"Source reliability report: 42 sources are healthy, 5 are inactive, 3 need attention, and 2 frequently produce irrelevant events."

Status

Future feature.

13. Admin Agent

Idea

An Admin Agent could help maintain the source and topic registry.

It might suggest:

- Deactivating sources that have produced no events in six months.
- Merging duplicate topics.
- Adding exclusion keywords to noisy topics.
- Updating event page URLs that appear to have moved.
- Flagging sources that now use Luma, Eventbrite, or another platform.

Guardrail

The Admin Agent should only suggest changes. Human approval should be required before registry changes are made.

Status

Future feature.

14. Partner and Co-Host Analysis

Idea

Analyze which organizations are co-hosting events together.

This could reveal clusters inside the abundance ecosystem.

Example Questions

- Which organizations collaborate most often?
- Are housing groups and energy groups overlapping?
- Which universities are connected to the ecosystem?
- Which think tanks are co-hosting the most events?
- Are local civic groups becoming more connected?

Status

Future feature.

15. Quality and Relevance Feedback Loop

Idea

Reviewer decisions could improve future classification.

If reviewers repeatedly reject certain types of events, Abundroid could learn that those are less relevant. If reviewers repeatedly approve certain topics, the system could prioritize them.

Example

If events about real estate investing are often rejected, the system could suggest adding “real estate investing” as an exclusion term for housing abundance.

Guardrail

The system should suggest rule changes rather than silently changing classification behavior.

Status

Future feature.

16. Multi-Ecosystem Support

Idea

The system could eventually support more than one ecosystem.

For example:

- Abundance ecosystem
- Water infrastructure ecosystem
- Housing ecosystem
- Energy permitting ecosystem
- Civic tech ecosystem
- Local government innovation ecosystem

Each ecosystem could have its own source registry, topic registry, review queue, and digest.

Status

Long-term future feature.

17. API Access

Idea

Approved events could eventually be exposed through a simple API.

Possible uses:

- Public website
- Partner websites
- Calendar integrations
- Internal dashboards
- Research tools
- Ecosystem mapping

Guardrail

The API should expose only approved public event metadata.

Status

Future feature.

18. Research and Reporting Layer

Idea

Abundroid could produce monthly or quarterly reports about the abundance ecosystem.

Possible reports:

- Monthly abundance events report
- Housing abundance activity report
- Emerging topics report
- Most active organizations report
- Regional activity report
- Speaker and partnership report

Example Summary

“This month, housing and permitting remained the most active topics, but water infrastructure appeared in six events across three states. The most active cities were San Francisco, Washington D.C., New York, and Austin.”

Status

Future feature.

Proposed Roadmap Phases

Phase 1: MVP Event Pipeline

Build the basic system.

Includes:

- Source registry
- Topic registry
- Event collection
- Normalized event records
- Human review queue
- Basic topic tagging
- Duplicate detection
- Basic query support

Phase 2: Focused Agent Support

Add cautious, focused agents.

Includes:

- Classifier Agent
- Deduper Agent
- Source Health Agent
- Query Agent
- Digest Drafting Agent

Phase 3: Better User Experience

Improve usability for non-technical users.

Includes:

- Add organization form
- Topic management interface
- Source health dashboard
- Review queue improvements
- Saved searches
- Better export options

Phase 4: Ecosystem Intelligence

Move from event tracking to ecosystem mapping.

Includes:

- Speaker tracking
- Organization relationship graph
- Topic trend dashboard
- City and regional mapping
- Partner/co-host analysis

Phase 5: Proactive and Personalized Features

Add opt-in proactive features.

Includes:

- Personalized alerts
- Event recommendations
- Custom weekly digests
- Watched topics and speakers
- User-specific location filters

Phase 6: Public and Partner Integrations

Expose approved data for broader use.

Includes:

- Public website
- Public calendar
- RSS/iCal feeds
- API access
- Partner embedding
- Monthly ecosystem reports

Not for the Initial Build

The following should be explicitly saved for later:

- Autonomous web discovery
- Public website
- Personalized alerts
- Deep relationship graph
- Speaker influence ranking
- Automated newsletter sending
- Full custom dashboard
- API access
- Multi-ecosystem support

- Advanced trend reports

These are valuable ideas, but they should not distract from the first goal: creating a reliable, human-reviewed event pipeline.

Summary

Abundroid should begin as a practical event pipeline, not a fully autonomous agent.

The early system should be intentionally conservative: approved sources, editable topics, human review, and simple querying. Over time, focused agents can make the system smarter by classifying events, detecting duplicates, suggesting sources, drafting digests, and answering natural-language questions.

The long-term opportunity is much bigger than a calendar. Abundroid could become a lightweight map of the abundance ecosystem, showing which organizations are active, which topics are rising, which cities are building momentum, and who is shaping the conversation.

But the path should be layered:

Reliable first. Useful second. Agentic third. Public later.
